

To: The FCC

From: David Karpenko

It has come to my attention that the FCC is considering the technology used by TVGuardian as a required install for all media devices, namely DVD's, Blu-Ray, and anything else that can support Closed Caption language guard technology. I have been a user of this technology for a number of years now and have found it to be essential in regard to my family's home entertainment. It has even determined what we rent and what we don't rent. For example, films from Universal, though they are quality and well done, are often not used in my home, because they most often do not have Closed Caption for our TVGuardian to use.

There are millions of concerned parents out there that would use this technology if it were more readily available. I know from personal experience that it is not very easy to locate when buying a DVD player. If it were more main stream, it would most certainly have a greater demand. The beauty of this idea is that it gives individuals a choice regarding what they and their families permit within their homes. The accuracy of TVGuardian is very good and would probably only improve as it does become main stream. Considering the pro's and the con's of such an endeavor, I can only see pro: more satisfied customers, increased sales of videos now that there is protections available, and freedom of choice. I would highly recommend that you implement this technology into main stream use for the better of all. Thank you for your time.
