

We need to make sure that when developing broadband that it has a minimum speed that's well above the average DSL speed now. We need to soon phase out dialup which is a waste of technology costs this day and age. Even in communities where population is small, they still need access to the fastest speed available. Creating a fast connection in an urban area can actually bring business to the community (hot spot shops, local wireless access at stores). We are the most powerful countries in the world, and we need to represent that in many ways and one way to help advertise that is to make sure that we have a fast, efficient, and powerful enough to make other countries envy us. :)
