FCC Docket 08-165

National Broadband Plan For Our Future

It is urgently required that citizens and communities retain the right to regulate wireless infrastructure build-out. The choice for connectivity under the National Broadband Plan for Our Future should be FIBEROPTIC. Broadband over Powerlines (BPL) should not be allowed because of the danger it represents both to human and animal health as well as the vitality of the plant world.

Many thousands of people are already adversely affected by radio frequency emissions in this country. We are “invisible” because of necessity we have had to “drop out” of ordinary life. Many of us are now in a desperate situation hardly knowing where to find safe havens as radiofrequency radiation increases. I ask that you give careful consideration to an issue that now affects a relative few of us but has every potential to impact the health of vast numbers of people as well as future generations. (In every environmental health issue it is vital to determine the mechanism whereby health is being impacted. The German article by Ulrich Warnke identifies NO/ONOO cycle which echoes the work done by the Washington State researcher Dr. Martin Pall).

I attach my own testimony and a German study / article that I believe will inform your decision making.

Sincerely,

Nicols Fox
