

The Internet, regardless of protocol (www, voip, ftp, etc...) is not just a medium for communication and dissemination of information. The Internet is a utility used in the great majority of American households, learning institutions, religious organizations, businesses, government offices, and many other venues - used for exercising rights guaranteed by the constitution of the U.S.A. (e.g. people study and practice respective religious beliefs, people exchange views, ideas, and ideologies, many work online from home) Allowing Internet Service Providers to alter connection speeds, or even to prevent certain types of use based on content or protocol allows privately owned businesses to violate U.S. citizens' rights to free speech, free religious practice, and right to assemble (via on-line meeting software). Phone companies are not allowed to alter signal quality based on the destination of a call, therefor neither should ISP's be allowed to restrict internet signal quality based on the protocol used or destination web site of one's browser. Please do not allow corporations to restrict rights where the government is prohibited to do so.
