

You must know the Internet was built on the principle of Network Neutrality. Back then, they called it "intelligence at the edge," but the concept is the same. The Internet is the product of efforts to create a communications technology that could support *any* type of (digitized) communication, regardless of its source or destination, and regardless of the owner of the medium through which it traveled. Furthermore, this principle remains the single most critical and characteristic principle of the modern Internet. Anyone may create content and make it available via the Internet to anyone and everyone who has access to any other part of it. That is the vision of the Internet and it has been realized.

Please make all conceivable efforts to protect this core principle. Without it, the Internet will be incapable of providing the services it already provides and will cease to be the foundation for innovation for which it is celebrated.
