

Cellular repeaters are an integral component in making the signal of wireless carriers usable in rural areas, dense buildings, and where other objects obstruct the already weak signal. Wireless carriers have attempted to improve their coverage with licensing new spectrum at lower frequencies such as AT&T with the 850 mhz rollout. This still is not enough to bring adequate wireless service inside my house. More and more consumers are getting rid of landlines. Removing cellular repeaters from the equation has the potential to leave lots of individuals without a way to dial 911 if an emergency situation ever arises.

Thank you,
Jeremy
