

We use a Wilson amplifier and antenna system to boost our signal strength at home so that we can use our wireless data card (otherwise we would be on dial up). We also use a system in our work vehicle, so that we can make calls and keep in contact with customers. In rural areas, such as the Ozarks, signal strength from cell sites is irregular. Wilson makes good products that include automatic gain control, oscillation protection, and overload protection. There is no reason why the cell phone companies need to have control of properly manufactured products. Thank you.
