

Chairman Genachowski or whomever this may concern at the FCC,

The problem with allowing ISPs to prioritize traffic and web content is if they are able to filter any content or services on the Web they would have to be able to look at every packet to know what's in it to be able to judge whether it meets their criteria for filtering but that could lead to an invasion of user privacy, As I have stated before in this Net Neutrality docket filtering of illegitimate content like spam email is one thing but we should not allow incumbent ISPs to discriminate against content they dislike or disagree with etc. As such cable company ISPs should not be able to discriminate against online video services in an anti competitive manner to protect their digital cable TV businesses.

We need Net Neutrality rules to protect Internet users and the FCC needs to protect its legal authority to implement and enforce them by reclassifying broadband as a telecommunications service so your agency can re-regulate broadband. You also need to reclassify to protect your legal authority to implement The National Broadband Plan.
