

I wish to register my concurrence with the proposal except for the inclusion of Pactor III.

- 1) As this is a channel of limited bandwidth, it should be limited to modes with an emitted bandwidth of 500 Hz in order to allow more than one user at a time to use the frequency.

- 2) Pactor-III will automatically vary in emitted bandwidth according to conditions. The ARRL claim that Pactor-III is a "narrowband" mode is misleading. Its bandwidth varies from 500 Hz to 2100 Hz, and is only "narrowband" at its slowest speed setting.
