

Any Cable cards should fully support ALL avenues of Closed Captioning and should also pass through any close caption data, in every type of output it may support.

To do less would be to discriminate against those of us who need captions... do not let another "HDMI" occur where the devices etc do not support close caption decoding, pass through, etc

We rightfully expect and should have caption data not be interfered with by any type of device operators install, all devices **MUST** support all types of closed captioning data.
