

The internet is an incredibly powerful tool to solve the worlds' problems. Allowing any individual or group to provide preferential access to it would be a devastating blow, creating a "market inefficiency" that would exert influence at every level of connection.

The most successful public policy toward internet is where there is robust competition, and where service providers cannot preferentially handle "bits". The internet should be a commodity like electrical power: a bit is a bit, and a kilowatt is a kilowatt. Sell me as much as I want for a price we both agree to, and then step aside. Only with such a free market can the healthiest internet economy thrive.
