

Keep data neutral. A data packet should be given equal access to internet infrastructure and transport methods regardless of the sender's or receiver's identity and net worth.

Putting data into a caste system will detrimentally affect many sectors of the 'net such as commerce, research, and collaboration. While corporations may claim to own the infrastructure, subscribers subsidized their networks. Additionally, these corporations do not own all 'net content and no one should have priority over anyone else.

Everyone should have equal access and passage through the highways and byways of the Internet.
