

Please be advised that Cell phone design is hiding the buttons which are so critical to recognize which button is being press to implement connection.

On some phones , the buttons are so small, it's easy to press two buttons simultaneously unintentionally which creates input interruption.

I would like to see a cell phone that is physically two inches wide and six inches long when opened up to receive a call. or two inches wide by 3 inches long for the number pad and other buttons needed to operate the phone.

Sincerely,

Alonzo W. Varnon Jr.
