

I am in strong support of single slot TDMA and any other digital form of communications on the amateur bands. We simply are having an overcrowding issue, much like the public safety and commercial two-way was and I would promote any more efficient use of the spectrum. The overcrowding has spilled out of being just a southern California problem and is being noticed on the front range of Colorado as well as other more populated areas.

The part 97 rules just haven't moved with the times, amateur radio is about emergency communications, a hobby and experimenting with different things (including more efficient modes of communication).

I would ask the commission to move swiftly and adopt these changes.

Respectfully,
Tom Jungmeyer
