

As a rural internet customer I sympathize with efforts to widen broadband availability. But I don't believe that LightSquared has come up with a workable solution. I think they are trying to lay the burdens of their faulty business plan on the shoulders of existing GPS-band users.

I quote from the report:

"We know of no currently available receiver, filter, antenna or other mitigation technology that would enable the construction of future wideband High Precision Timing, or Network GPS receivers and augmentation systems that are compatible with the Phase 0, 1, or 2 LightSquared rollout plans." (p 181)
