

I work for a multi-location John Deere dealership. A good chunk of our company focuses on providing GPS equipment to farmers in our area. GPS systems are a vital need to all agricultural fields. It helps growers become better stewards of the land, while also helping them produce more food more efficiently for the world.

If Light Squared is allowed to go through with their proposal, the effects on jobs in all industries utilizing GPS will be greatly affected.

The United States population roughly doubles every 65 years which means we will need to provide more food. This population growth doesn't even include the other nations that purchase our food for export. Without GPS systems in agriculture, not only agricultural jobs, but the nations food production as a whole will be blind-sided.
