

Land Surveyors use GPS literally on a daily basis and to interrupt our service so more people can talk/text/surf the web on their phones is ridiculous and would cost us an unimaginable amount of money in down time if our GPS signals are interrupted every time someone makes a phone call. I believe this installation by Lightsquared however beneficial to some would hurt many more. Lightsquared must take into account the vast array of business' that would be affected by this change, i.e. anyone who uses GPS for navigation purposes, D.O.T.'s throughout the country as well as GIS departments so on and so forth. Besides, if we are in a position of "no-cell" service, then maybe that phone call isn't that important... sans emergencies of course.
