

I am a GIS Technician for Greenville Water System, and one of my duties is to GPS the infrastructure that makes up the water system. This work covers most of Greenville County, and small portions of neighboring counties. Without GPS, I would be unable to do my job which is a vital part of delivering clean drinking water to our customers. I am not opposed to having more access to wireless broadband, but it should not come at the expense of the already-in-place and massive GPS industry. Please tell LightSquared to use a frequency that does not interfere with GPS. Thank you.
