

After waiting for 3 generations of mobile phone technology to converge in the United States, now we find that Verizon and ATT have selected different frequencies for their LTE networks.

So while residents of much of the rest of the world can purchase phones independent of carriers based on best service and pricing, enhancing competition, once again US consumers are hamstrung by this blatant act to maintain a duopoly in mobile phones.

How can the FCC allow this to happen. The frequency choices are once band away from each other, there is no justifiable reason for them to choose incompatible bands and not allow consumers to roam these networks and choose their phones and services based on best offers.
