

GPS is NOT easily replaced or modified. All of my existing equipment in vehicles, tablets, laptops, and phones would lose important functionality, and would require expensive replacement of the entire unit should GPS not be functional or become unreliable. Personally, this would cost in excess of \$5,000 to me, and the replacement technology has not been developed, so position information would be 1. expensive to replace and 2. not available at all for at least several years. THAT UNAVAILABILITY cost is a lot more than the cost of the equipment, because I spent the money to buy the equipment knowing the benefits are greater than the costs.
