

Testing has shown the the bandwidth that LightSquared is proposing to use for their new broadband services system is incompatable with the esixting GPS system and actually interferes with GPS. While we all appreciate the importance of broadband communications, we also understand the huge importance of GPS as well. It would seem foolhearty to implement a new service that would render the GPS system inoperable. Remember that GPS is an intregal part of navigation for the following and more:

General Aviation, Commercial Aviation, Military (smart bombs etc) automotive navigation, search and rescue, recreation, marine navigation, trucking, NASA, etc, etc. We cannot afford to jeopardize the GPS system.

Find another way to accomodate more broadband. Don't let Twitter and Facebook eliminate a very valuable and important navagation tool.
