

I think it is a really bad idea to mess with the GPS frequencies. Far too many things depend on GPS, from aviation to search and rescue, marine navigation to lost tourists finding their way through an unfamiliar city. There are also many location-based games these days, as well as the huge Geocaching movement. All of these activities generate vast amounts of cash flow, which boosts the American economy. If people can't rely on the GPS service, then what? Do we all need to switch to Galileo? How much would that cost the American economy?
