

I am a pilot and depend on GPS for navigation. I have recently purchased an expensive GPS unit and I find it unacceptable that LightSquared has even the possibility of doing something that will interfere with GPS signals. If they are to go forward with this, it should be understood that they are responsible for preventing any interference ie filter their signal, don't expect me to undergo the expense of purchasing and installing a filter for my unit. There is no "greater good" that should give them license to destroy the capability of a system already in wide use. There is only "greater money". They must prove beyond a doubt that what they are proposing to do will not interfere with anything currently in use.
