

As an appraiser I routinely make use of GPS in my work; without being able to reliably locate property boundaries I would be unable to give an accurate and reliable estimate of property value. I understand that this proposal would negatively effect the reliability of GPS connections and, as the use of GPS is extremely wide spread I do not feel that it should be allowed. My issue aside, with GPS installed in most cell phones and new cars, as well as all of the portable devices on the market, I suspect that interruption of GPS signals would cause a substantial burden for the FCC. I think that in light of our budget mess the it would be in the best interest of the FCC to protect GPS signals and in so doing protect themselves from lawsuits and a litany of complaints.
