

It is our understanding that the expansion proposed by LightSquared will disrupt the high accuracy standards currently in place for GPS land surveying services. Even the possibility of disruption undermines that current and future usefulness of the entire system. GPS has become a critical tool in the Surveying and Mapping industry. The proposal by LightSquared ignores the rights of those that depend upon the GPS technology for their business. The FCC should deny any proposal that interferes with the current standards and practices that took many years and considerable funds to develop.
