

As a Surveyor I use my GPS system every day. As more municipalities are using GIS systems that require my data to be on the State Plan Coordinate System. Any interruption of the GPS signal would render my equipment USELESS. My prices would also have to go up because I would be forced to traverse from some type of GEODETIC monument to the job site to set control and then traverse back to the monument to check for errors. This process will add DAYS to what would be an HOUR job with a working GPS system.

Please protect the GPS signal from being over powered by LightSquared's Signal.

Thank you for the help.
