

Gentlepersonâ??s of the â??Federal Communication Commission:

I find myself deeply disturbed with the possibility of the â??GPSâ? system being compromised in any way, especially that which is proposed by and experimented with by the â??LightSquared â??.

We use â??GPSâ? systems in a hand hailed unit extensively when traveling, however this is not the thing that disturbs me the most. The â??GPSâ? technology has become critical for the Agricultural community for the planting, sprayings, fertilizing, watering, and harvesting of crops. Without the use of various â??GPSâ? units used in the production of crops, yields would be greatly reduced, thus increasing the cost to the end user or consumer. The radio frequency used by the â??GPSâ? systems must be isolated from any other systems so as to not to have any interference with the clear operation of the â??GPSâ??sâ? in any application.

Other area of concern for me is that of the interference with the emergency response system built into cell phones witch may be compromised and in many cases just a few drivers not familiar in congested traffic areas would make the matter worse without their â??GPSâ? to help them navigate in such conditions especially in larger metropolitan areaâ??s.
