

I am an individual who suffers from dysarthria, due to a Traumatic Brain Injury I suffered some 24 years ago. Although I have overcome most of the issues I suffered, my speech is still a big problem and even more so with the phone and the person on the other end not being able to see my body language/mouth movements. VID-STS would make it possible for me to communicate with individuals whom I call using the CA-Operators. Also, Potential users of STS include people with Cerebral Palsy, Parkinson's, ALS, and other speech disabilities.
