

As an avid boater and business traveler, the use and availability of GPS is extremely important to me and my family in numerous ways. If you allow the availability of GPS to be impacted it would impact the safety of my family as we rely on GPS for our know position on land and water. Additionally, It would impact my ability in business as I travel about 30,000 miles per year to customers in the US and Europe. Even though my background is the computer industry, having one technology (wireless broadband) impact another technology (GPS) is unacceptable and makes no sense at all. I submit that an impact on GPS by LightSquared's proposed network would have disruptive consequences to millions of people's safety, business and lifestyle. I cannot imagine that any responsible government agency would allow this to happen.

Therefore, I challenge you, the FCC, to protect the integrity of the GPS signal used by your citizens and those of other countries and that I fully support their recommendation to stop LightSquared's current proposal.

Thank you in advance for making this vital decision.
