

I do not believe that any communication system that has been shown to degrade GPS signals is in the best interests of the public.

For myself, I use a WAAS enabled GPS system to navigate the California Coast, often in dense fog. I have Radar, but radar does not show your own position or drift, if I were to lose my GPS positioning system at a critical time, it could endanger my passengers, my crew, my vessel and myself. Not a pretty picture!

To allow one company to use a system to make money, while endangering many thousands of individuals is a criminal act, and would most probably cost our government many millions of dollars in fighting lawsuits.
