

I own a boat and rely strongly on GPS for navigation. I am also a member of the Coast Guard Auxiliary, and we make extensive use of GPS in our patrols and in responding quickly to emergencies on the water. Losing or downgrading GPS would have disastrous consequences in both of these areas. While wireless broadband service is important, it should not come at the expense of GPS, and all studies show that the proposed network would cause interference, for which there are no remedies. Thank you for your recommendation to stop LightSquared's proposal. Please know that I and many others are relying on you to protect the integrity of the GPS signal.
