

I am a consumer, avid boater and user of GPS in my cars and on my boat. I am very much opposed to Lightsquare's attempt to expand their operating frequencies.

Their answer to the problem is to offer a weak "fix" by using a filter that they will make available to government GPS users.

What about the rest of us? What about those of us who operate our boats offshore? Also, there is no way to install this filter on the millions of GPS units in use. There is no slot that says "Plug Filter In Here".

I don't really believe there is a filter that's capable of filtering out all the noise that Lightsource will generate with their signals.

This appears to be another attempt by a well-financed company to run roughshod over the consumer so they can add to their coffers.

I respectfully request that you consider the needs of the consumer public and put those needs ahead of Lightsource.
