

Hello, I use GPS in 3 main areas of my daily life. First, when driving my vehicle in unfamiliar locations/destinations. Second, while hunting during rifle and grouse hunting seasons. Lastly, I use GPS while fishing Lake Superior and Lake Michigan. The accuracy and convenience of GPS allows me to optimize my time on land and water for finding certain destinations or hotspots. If this were taken away, it would be setback in my time spent on land and water as more time would need to be used in finding hard copy maps and plotting nautical charts. With today's busy schedules, GPS allows a fast-track to all of these hard copy navigation tools. Wireless broadband may be important in today's society but it should not come at the expense of GPS. All studies show that the LightSquared's proposed network would cause GPS interference and there would be no remedies. I rely on the FCC to protect the integrity of the GPS signal and I support the recommendation to stop LightSquared's current proposal. Thank you.
