

As much as I am in favor of private business, When it comes to services which benefit anyone and everyone, I have to give priority to that service. Because we are physically limited in our broadband availability, GPS should take precedence and any interference in this highly valuable system should be seen as a potential crisis given the reliance on this system by shipping and air pilots and co-pilots. A great many recreational boaters rely heavily on this system as well. To lose this effective tool of navigation could be catastrophic to a greater population of private businesses than to this one business which wishes to shoulder its way into an already small and overcrowded space. I'm sorry, but I feel they should have to respect the reality of space and time like the rest of us.
