

GPS has become an important part of my life. My wife and I both use it to get to, or get home from places I am unfamiliar with in my car. I use it in my boat to assist in safe navigation for me and my family, especially at night.

If GPS became unavailable it would cause a safety issue for me and my family. While wireless broadband service may be valuable to some, it should not come at the expense of a system we have used and trusted with our lives for many years.

I understand that studies have shown that LightSquared proposed network would cause interference to the GPS network and that there are no available remedies for this interference.

We rely on the FCC to protect the integrity of the GPS signal and I support efforts to stop LightSquared's current proposal.
