

I use the GPS system both on the water and in my auto. I find it is imparitative in my car in cities like Washington DC but its use would not generally put me in a life threatning situation if it was not operating properly. In my boat and the boats of the US Coast Guard and other life savers this could cause a loss of life. I live in an area where the bays are shallow and exact navigation is essential. Our wirless systems are important but they must be designed not to effect the operation of our GPS system that could have life effects of those on the water. I look to the FCC to prevent the LightSquared's current proposal.
