

I believe that LightSquared will be a huge step toward better coverage and services at lower, more affordable prices than the big cellular companies. I believe LightSquared more cellular capacity so that more calls can go through in case of an emergency. As technology advances more and more, it is imperative that we develop a communications system not just for this nation, but the entire world.

Which brings me to my next question: Why put a monetary price tag on anything that's for the benefit of humanity and/or the planet if it's meant for just that, the benefit of humanity and/or the planet? If you really think about it, money is not natural, nor is it practical; you can't use it for anything if all other things on Earth were eliminated, leaving the planet a barren wasteland with nothing except money lying and floating around. However, if you go the other way and eliminate the monetary system, you still have the resources to support humanity and the planet, as long as those resources were used wisely.

So, I propose a system where, in the case of cell phone coverage and services, it is 100% free and accessible to everyone on the planet. Think about the possibilities. No one would ever have to worry about, "Can I afford this for me and my family?" anymore. That and many other questions would become irrelevant with the resource-based system that I'm proposing above, rather than the monetary-based system which we currently use globally now. There would eventually be zero war, poverty, crime, discrimination, unemployment, etc., if the whole world pitched in on this amazing new system. The only thing holding people back then, would be whether they would WANT to do it, not whether they could AFFORD, monetary-wise, to do it.

Think about all of the above that I have written to you guys, and visit this website for more information:
