

hello, i use gps systems for my daily life, in my car and especially on my boat, we do a lot of night time navigation where with out our gps's on track we could run the boat aground at 33kts!! this could be deadly, i would hate to potentially kill my family because of some stupid cellphone network (when all phones work fine as is) if anything the gps networks are much more important and **MUST BE PROTECTED**, figure out another way to call people GPS systems are way too vital of an instrument to ruin with a phone network. many of my comrades are commercial fishermen, how do you expect them to find they're secret spots when they're gps's are no longer working properly, how are you supposed to navigate home?!? Please, it would just be wrong to allow this to happen.
