

I support your recommendation to stop LightSquared's current proposal. I personally use GPS on the water (power boat and wilderness kayak) and on land (road and wilderness excursions) and professionally as an emergency services rescuer/provider (paramedic).

Wireless broadband service is important but interference with GPS has the potential to jeopardize lives and safety. A LOT more work needs to be done to protect GPS before allowing and form of communication to compromise this. Let's put public safety above public convenience.
