

As T-Mobile USA has explained Verizon Wireless has sufficient AWS spectrum already that it is under-utilizing in addition to the 700 MHz Lower A & B block spectrum they propose selling to alleviate spectrum concentration concerns and win approval for their deals with Big Cable companies. If Verizon Wireless chose to do so they could use both their existing AWS spectrum and their existing 700 MHz spectrum for their 4G LTE rollout. In fact if Verizon Wireless wanted to they could create 2 wireless 4G LTE networks 1 using 700 MHz spectrum and the other with AWS spectrum. Verizon's proposed 700 MHz spectrum sale also threatens any hope for 4G LTE interoperability. I urge the FCC to deny Verizon's transactions and stop their shenanigans with the big cable companies.
