

Comcast which is seeking to sell Verizon Wireless spectrum is violating Net Neutrality. By the way the SpectrumCo/Cox deals should be denied, and interoperability and AWS Service Rules be mandated.

A FaceTime call from my house to my neighbor's—which never leaves even the San Francisco metro area Comcast network, given that both of us are Comcast customers—goes over the “public Internet.”

Yet Comcast's Xbox streams, which pass from Seattle to Sacramento to San Francisco through all of the same network elements that handle my video call (and then some!) are exempt from the bandwidth cap?

You can't have it both ways, guys. DOCSIS 3 technology has vastly expanded the last mile pipe into subscriber homes. If Comcast can launch their own private pipe for unlimited IPTV traffic that travels down the same wires their Internet service does, they can comfortably handle any additional capacity needs to support their “constrained” broadband service without the need to limit their customers' use. Usage caps remain an end run around Net Neutrality. Comcast must apply its data cap equally to XFINITY TV or not at all. Capping Netflix and Hulu but not XFINITY is not right.
