

Like everyone else I use GPS on a daily basis and would not want to hurt it's functionality. At the same time, I feel this country desperately needs additional options and lower prices for cell phone users. In this case both imperatives must be balanced.

I believe that the alternative plan submitted by Lightsquared is more than adequate. No one is going to be materially impacted by interference to GPS signal of less than one percent. Powerful interest are trying to exploit this extremely small amount of interference to prevent the disruption that this service would provide to their interests. Please don't allow them to get away with it.
