

There are little to no options for Broadband. My current ISP is .8 bps upload and 3mbps download via DSL. There are only two DSL providers in my area and none of them offer any speed increase. This has been the same for the past 10 years without any change in service but always the ever increasing costs to the consumer. Comcast is the only other provider, and their service is atrocious. From their ever changing latency, customer service, constant billing issues, data caps and all out monopoly on High Speed Broadband. Verizon, AT&T, Comcast have all but killed competition. Expecting broadband on wireless LTE technology to create more competition and offers is a joke. The large companies control the spectrum and it will never have the consistent speed, latency and performance that a wire/fiber could offer. What happened to government breaking up monopolies. I've traveled to other countries in Europe, PAN Asia and South America. Every place I've been to has had better performing broadband than in the US. Some of these places have been rather remote and they still have stable, fast and affordable broadband without data caps. When is the FCC going to stop letting monopolies make the rules? When is the FCC going to look after the rights of consumers?
