

My comment is that the standards for Broadband are too low. The technology exists to make Internet speeds far faster than they are in most areas. I have Comcast, and the performance of my service, considered Broadband, is in my belief comical. The next closest competitor, which is unavailable in my area, is DSL, and if I could get it, would be even slower than Comcast. Verizon 4G mobile broadband is on average 3-4x the speed of my at home Broadband, but the price is also 3-4x greater and more than what I currently have for the same amount of usage. True broadband is Google fiber. We need to look at adopting this standard across the United States, and we need to have true choice. The United States has devolved into nothing more than a Corporate Communist model. We have no choice but the choice that is presented. I grew up learning about monopolies and that the United States fought to give us choice. The choice that we have however is laughable. The standards are as well. Just because it's a step up from Dial-up does not make it Broadband. We have the ability, let us put it into action.
