

Hello there, I noticed that many dvd discs have closed captions instead of English subtitles so I think all portable dvd players should have a closed caption chip so that closed captions from movies can be displayed on the built in screen of the portable dvd player.

There is another issue I do like to bring to your attention in addition to being deaf I have glaucoma and I noticed that videos with resolution higher than 250p and 360P tires my eyes big time..It would be nice if all tv , dvd players and bluray players let folks chose resolutions of 250P,360P,480P,480i,720P or 1080P..Put it this way like some people's ears are sensitive to high audio volume some people's eyes are more sensitive to higher resolution.

Another thing is that I noticed that when using a computer, tablet or smartphone and display resolution above 1054X720 tires my eyes..It would be nice if future computers , tablets and smart phones have a 1054X720 display option in addition to the HD option..I also want to tell you that It is not the brightness or contrast that is causing the tireness of my eyes...It is resolutions about 250P and 360P for videos and display resolution above 1054X720..I am sure there are other folks with same problem..Please look into making these things a requirement..Thank you and have a nice day.
