

I literally just wrote an essay on how the FCC is charged with informing the public on what to do when disaster strikes therefore I will reiterate myself once again. It is imperative that the FCC continuously advertises and informs the public on what can be done on the public's behalf in order to prevent chaos in all ways whether it be a storm, earthquake, nuclear war, fire, etc. It is surprising that there are still no form of at least having one secure way of communication when there is an emergency. Rather than attempting to create new devices, maybe it's time to take a step back, create a "damage-proof" service that can be located in several areas of each town or city. The public is not fully aware nor does it have immediate knowledge of how the telecommunications industry works so it's time to educate and the best way to do so is to start with ads - it's been proven to be the most effective way of people learning issues and how to take measures into their own hands.
