

Researching "late fees" for internet service, I came across a rule which states that a provider, according to FCC policy, is authorized to charge up to 25% of my gross bill. The late fee on my last bill was 22.78 percent (23%), which falls within FCC rules. My bill for March, 2013, is \$37.40. The late fee (even for one day late) is \$8.52. While only partially blaming my server, this falls on the shoulders of the FCC. Which scientist within the FCC, persuaded the rest of you to agree to such a large percentage?

Some of us are elderly and disable. I live on 700.00 a month and food stamps. I am a voluntary advocate for the elderly and disable. I need the net. Are there not any ways to ammend this ruling and bring the high percentage of late fees down?

We are not all equal. Maybe I'm a socialist pig and an anti-capitalist; however, on behalf of many who are in the "same boat", I rest my case.
