

"This grant of experimental authority regarding the 1675-1680 MHz band is an important step towards making additional spectrum available for commercial broadband use," LightSquared said in an emailed statement. This on the surface, only appears to be a conciliatory jest since the original Mhz band originally authorized to Lightsquared for use was found to conflict with existing GPS devices. Perhaps these devices should be updated? Or perhaps this is only a farce? The government cannot hold ransom the full band of wireless spectrum. After all, the wireless spectrum belongs to the people of these United States, not the FCC. Give the people what they want, let them vote for it.
