Standards for human exposure to radio frequency radiation should be more restrictive. My life has been ruined by a severe case of electromagnetic hypersensitivity (EHS). I get a severe headache, chest pains, tinnitus, ear pain, and eventually flu-like symptoms from exposure to low frequency 60 Hz all the way to RF. Cell phones cause an acute, immediate reaction which lasts for days, or weeks depending on the length and strength of exposure. I was injured by using a cell phone and CRT monitors. Your current standards are primitive and based on the rise in temperature of a rat's ass after just a few minutes of exposure. Meanwhile you permit children to be irradiated in schools for hours on end. I'm an electrical and biomedical engineer, not some delusional freak. I won't go down without a fight when you thugs come to my house and try to install a wireless smart meter. A smart meter is a threat to my existence. Your standards must be lowered by at least a thousands times. EHS is a world-wide epidemic, and the FCC is directly culpable for devastating a good percentage of the population.
