This in regards to the use of Pactor 4 modems in ham radio. The current rules, as I understand them, do not allow Pactor 4 modems to be used on the ham bands. This however is an obsolete restriction on the use of technology.

Allowing Pactor 4 modems on ham radio bands will not have any negative effect on bandwidths and will not change the band plans in any regard. It would merely allow faster transmission of data and improve the efficiency of said data across the air waves.

Please allow this change to go through and allow US hams to enjoy technology that is already widely accepted in many other countries around the world.

Sincerely,  
Robert Patty
